The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and c.N.S disorders

                                                                                                                                                                                                                                        δÃ
                                                                                                                                                                                                                                                                                                                                              CC The invention relates to novel nucleic acid sequences derived from rat CC dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, CC and mouse embryonic skin, keratinocytes stem cells and transit amplifying CC cells. Polypeptides of the invention may be used to treat inflammation, CC cancer and neurological diseases. The proteins may be used to stimulate CC the growth and motility of keratinocytes, to inhibit the growth of CC cancer cells, to modulate angiogenesis and tumour vascularisation, to CC inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, Skin wounds and hair follicle CC disorders. Sequences AAZ61606-Z61832 represent cDNA sequences derived CC conseveral mouse, rat or human skin cell types. Sequences CC AAZ61606-Z61649, AAZ61725-Z61765, AAZ61802-Z61811 and AAZ61826 encode CC proteins with an N-terminal signal sequence, indicating that the proteins care secreted. Sequences AAZ61650-Z61668, AAZ61766-Z61780, AAZ61812-Z61817 CC and AAZ61827-Z61829 encode proteins with one or more putative

The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cel modulating angiogenesis, inhibiting angiogenesis and vascularisation tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency vi (HIV)-1 to leukocytes, and treating inflammmatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of oligonucleotides for examining expression patterns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated polynucleotide used in the identification disorders and encoding polypeptides used for treating i disease, cancer and neurological diseases -

The membrane-bound proteins and receptor molecules are useful as pharmaceutical and diagnostic agents. Receptor immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                are useful as hybridization probes, in chromosome and gene mapping the generation of antisense RNA and DNA. PRO nucleic acid sequences will also be useful for the preparation of PRO polypeptides, espect

The PRO protein, and PRO agonists, PRO antagonists or anti-PRO antibodies are useful for preparation of a medicament useful in the treatment of a condition which is responsive to the PRO protein, agonists, antagonists or anti-PRO antibodies. The PRO protein may also be employed as molecular weight markers for protein electrophoresis. The PRO coding sequence has applications in molecular biology, including use as hybridisation probes, and in chromosome and

                                                                                 Qγ
                                                                                                              Вþ
                                                                                                                                   Qy
                                                                                                                                                                                                                                            The present invention describes human secreted and transmembrane PRO proteins. The PRO proteins have cytostatic activity. The PRO proteins or an invention describes have cytostatic activity. The PRO proteins or an invention of an invention of a consistency of bloactive molecules, such as compared to take the product of the produce transfer of anti-sense RNA chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO nucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays. AAF44270 to AAF4470 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAF44087 to AAF44269 and AAB65310 represent human PRO polynucleotide and protein consequences of the present invention.
                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             20-JUL-1999

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to polynucleotides (AAK51456-AAK5345) and the encoded polypeptides (AAK9323-AAM80302) that exhibit activity elating to encoded polypeptides (AAK98323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI;

The sequences exhibit activity relating to angiogenesis, cell proliferation, cell differentiation, stem cell growth factor, cell proliferation, cell differentiation, stem cell growth factor, activin or inhibin. Therefore, they can be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, accidental damage or genetic disorders. The sequences may also be used for regeneration of bone,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cartilage, tendons and ligaments and in tissue repair and burn healing. Note: Some sequences for this patent did not form part of the printed specification, but were obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequences AAS44576-AAS44919 represent full-length polynucleotides a contig polynucleotides encoding polypeptides of the invention. The and protein sequences are useful for the treatment, diagnosis and prevention of various types of disorder in a mammalian subject such

CC such as leukaemia, lymphoma and neuroblastoma, autoimmune disorders such as a feukaemia, lymphoma and neuroblastoma, autoimmune disorders such cc such as leukaemia, lymphoma and neuroblastoma, autoimmune disorders such cc as multiple sclerosis, connective tissue disease, include cancers cd diabetes mellitus, allergic rhinitis, asthma and eczema, nervous system cc disorders such as parkinson's disease, Alzheimer's disease, Huntington's cc chorea, amyotrophic lateral sclerosis, spinal muscular atrophy and cc wernicke disease, inflammatory disorders such as nephritis, Crohn's cc disease, ischaemia-reperfusion injury, shock, sepsis and inflammatory bowel disease, ischaemia-reperfusion injury, shock, sepsis and inflammatory cc cell proliferation, cell differentiation, stem cell growth factor, cc activin or inhibin. Therefore, they can be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to cartilage, tendons and ligaments and in tissue repair and burn healing. Cc artilage, tendons and ligaments and in tissue repair and burn healing. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DB seq
